

DAY & NIGHT

Orbit

The path of the earth around the sun.

Rotation

Earth rotates around a central axis. Earth does this on its axis.

Day

The day of time between sunrise and sunset.

Night

The day of time between sunset and sunrise.

Sun

The star that gives light and heat to earth.

Scenery

area about

Moon

A huge ball of rock that travels around the earth.

Reflect

To bounce off a surface.

Day and Night

Earth rotates as it orbits the sun. Because of this, we have day and night.

At any one place, at any one time, Earth has sunlight. If it has darkness.

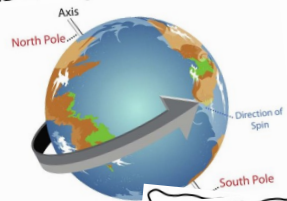

When we see the sun, it is day.

When we see the sun, it is day.

Each day is 24 hours because that is how long it takes the earth to make a single complete turn.

The sky at different times of the day you will see different positions.

From the east in the morning it is called sunrise.

In the middle of the day, the sun is at the top of the sky.

As the sun disappears, sunset begins.

Although it looks like it is the sun that is changing position, it is not. The earth is what is moving, causing the changes.

There is light and heat from the sun.

We can see these things in the sky.

At night it is cooler and dark.

We can see stars in the sky.

Sun and Moon Sequencing

Color the sky and draw the sun or moon to match what you would see outside.

Write or draw a picture of one thing you do during each of these times.

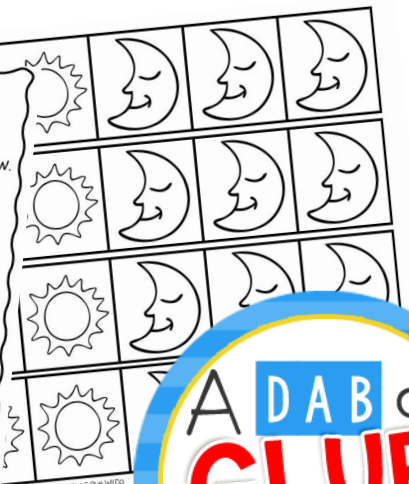

Day and Night Patterns

day and which side has night in the example below.

day and night by cutting and gluing the sun and moon below.
